Problem Statement ¶

A real estate agent want help to predict the house price for regions in USA. He gave us the dataset to work on to use linear regression model. Create a model that helps him to estimate of what the house would sell for

Import libraries

```
In [1]: import numpy as np
   import pandas as pd
   import matplotlib.pyplot as plt
   import seaborn as sns
```

```
In [2]: # To import dataset
df=pd.read_csv('Instagram csv')
df
```

Out[2]:

To Train the Model - Model Building

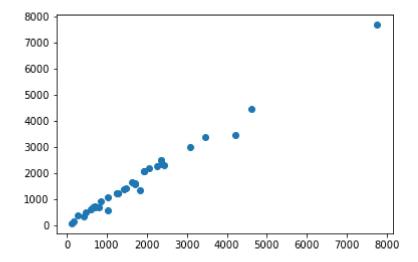

We are going to train Linear Regression model; We need to split out data into two variables x and y where x is independent variable (input) and y is dependent on x(output). We could ignore address column as it is not required for our model.

To split my dataset into training and test data
